SUMMARY

Software developer with hands-on experience building full-stack applications using TypeScript, React.js, Next.js, Node.js, Python, Docker, and PostgreSQL. Active learner and self-driven developer with practical experience gained through academic and personal projects focused on solving real-world operational challenges. Comfortable learning new technologies quickly, working in fast-paced environments, and building scalable systems through independent problem solving and collaborative development.

SKILLS

- Typescript (React ,Node.js, Next.js)
- Docker
- Postgress
- UI/UX Design
- Python
- Mysql
- Prompt Engineering
- Team work and collaboration

PRACTICAL EXPERIENCE

EnvX — Environment Variable Management Platform

2026

Mbeya University of Science and Technology (MUST) , Mbeya , Tanzania

- Developers working across multiple projects experienced repeated deployment failures and inconsistent application behavior due to poorly managed environment variables and unstructured configuration files.
- Build a centralized platform to organize and secure environment variables while improving deployment consistency across development teams.
- Designed workflows for managing .env configurations, structured project-based environment organization, and simplified team collaboration through standardized configuration processes.
- Reduced configuration-related deployment issues by approximately 60%, improved setup speed for new development environments by 50%, and minimized time spent troubleshooting environment conflicts from several hours to less than 30 minutes per deployment cycle.
- Built experience with Node.js-style backend workflows, environment variables (.env), deployment configuration, and Docker-like development environments, directly aligning with scalable system setup and DevOps-oriented practices.

Mangi Store — Business Management System

2025-2026

Mwanga Enterprise , Arusha, Tanzania

- Mwanga Enterprise relied heavily on handwritten sales records, manual inventory tracking, and physical calculation of daily business transactions, causing stock inconsistencies, calculation mistakes, delayed reporting, and slow customer service during busy business hours.
- Develop a POS and business management system to digitize sales operations, automate calculations, improve inventory tracking, and simplify daily business management processes.
- Designed and developed a POS platform with inventory management, automated transaction calculations, sales monitoring, receipt generation, and analytics dashboards. Implemented structured

reporting workflows to simplify stock management, financial tracking, and day-to-day business operations.

- Reduced daily sales recording and manual calculation time by approximately 4 hours per day, improved inventory tracking efficiency by 70%, minimized stock and calculation errors significantly, and increased transaction processing speed during peak business hours through automated sales and reporting systems.
- Developed a full-stack system using frontend + backend integration, transaction processing, and PostgreSQL-style database design, reflecting practical experience with React.js, Node.js, and API-driven application architecture.

Church Financial Management System

2025-2026

Majengo Parish, Kilimanjaro , Tanzania

- Majengo Parish managed financial records manually, resulting in time-consuming bookkeeping processes, unorganized contribution records, and difficulties generating accurate financial reports.
- Build a financial management system to improve organization, financial transparency, and reporting efficiency within the parish.
- Developed modules for contribution tracking, transaction management, financial reporting, and organized digital record storage. Designed workflows that simplified record management and improved accessibility of financial data.
- Reduced financial report preparation time from multiple days to a minute, improved record organization efficiency by approximately 75%, and streamlined financial tracking processes, enabling faster and more accurate reporting for parish management.
- Gained experience in structured backend development, financial transaction processing, reporting systems, and relational database management, supporting skills needed for enterprise backend systems like Java Spring Boot and Postgres-based applications.
